Email: ravindrad.java@gmail.com | Mobile: 9629787114 | Location: Hyderabad, India

CAREER SUMMARY

Experienced Java Developer with over 7.5 years of expertise in microservice event-driven architecture, skilled in analyzing, designing, documenting, integrating, testing, and implementing complex Client-Server

TECHNICAL SKILLS

Frameworks: Spring, Spring Boot, Spring Batch, Mockito, Karate Framework

Tools: Eclipse, Spring Tool Suite, Postman, GitHub, Jenkins, JMeter, Bitbucket, OCP (OpenShift), Confluence, Jira

Databases: MySQL, Oracle 11g, IBM Db2, MariaDB

Languages: Java, Kotlin, HTML5, CSS3, SQL

Architecture & Concepts: Microservices, RESTful APIs, Token Management, Database Performance Tuning, CI/CD, SSL Security

ACADEMIC DETAILS

MS in Software Engineering from Vellore Institute of Technology, Vellore, Tamil Nadu (2018) - CGPA: 8.5

FUNCTIONAL SKILLS

- Strong time management and task prioritization with Agile methodologies.
- Ability to grasp and apply new concepts quickly and efficiently.
- Excellent oral, written, and communication skills.
- Proven team player and collaborative developer.
- Strong initiative, ownership, and accountability for business outcomes.
- Database design and optimization for high-volume transaction systems.

PROFESSIONAL EXPERIENCE

Senior Application Developer

Project1: Enterprise Banking Modernization: TIBCO BW to Spring Boot Microservices Migration

Duration: Dec 2025 – Present

Description: Led the end-to-end migration of **20+ mission-critical banking services from legacy** TIBCO BusinessWorks 5.x to modern Spring Boot microservices architecture for DBS, delivered within an aggressive **6-month timeline**. The project involved re-engineering retail and corporate banking operations including customer management, account services, card operations, payment processing, and batch file processing. **Leveraged Claude Code AI with advanced prompting agents to automate and accelerate the entire migration lifecycle including analysis, design, development, testing, and deployment.** Designed, developed and deployed on OpenShift container platform. **Conducted comprehensive performance testing using JMeter** to ensure high scalability, robustness, and 99.9% uptime. Achieved zero-downtime migration, backward compatibility with existing enterprise systems, and seamless integration with Finacle core banking and COBOL mainframe systems despite the tight deadline.

Technologies: Java 17, Spring Boot 3.x, Microservices, SOAP Web Services (Spring WS), REST APIs, Spring Data JPA, MariaDB, Oracle, Spring Batch, OpenShift (OCP), Kubernetes, Docker, Resilience4j (Circuit Breaker, Retry, Rate Limiter), Micrometer,

Prometheus, Spring Actuator, JUnit 5, Mockito, JaCoCo, SonarQube, Git, Jenkins CI, JFrog Artifactory, Finacle (FIXML), COBOL Integration, Digi-Chassis 5.1.x, Claude Code AI, AI-Powered Code Migration, Prompt Engineering, LLM-Assisted Development, JMeter Performance Testing

Roles & Responsibilities:

- Led migration of 20+ TIBCO BW modules to Spring Boot microservices within 6 months using Claude Code AI with advanced prompt engineering, automating analysis, design, development, testing, and deployment on OpenShift.
- Engineered and iteratively refined AI prompts to generate Java 17 / Spring Boot code aligned with DBS Digi-Chassis 5.1.x, ensuring design patterns, banking compliance, and enterprise security standards.
- Conducted JMeter performance testing to validate scalability and robustness, achieving 99.9% uptime, zero-downtime migration, and backward compatibility with Finacle (FIXML) and COBOL mainframe systems.
- Built reactive APIs (Spring WebFlux), batch processing (Spring Batch), SFTP file transfers (Apache Commons VFS2), and integrated Spring Data JPA with MariaDB/Oracle using HikariCP & Flyway.
- Implemented resilience patterns (Resilience4j) including circuit breaker, retry, rate limiting; containerized with Docker, deployed on OpenShift/K8s; integrated Micrometer, Prometheus, and Spring Actuator for monitoring.
- Maintained 80-90% unit test coverage using JUnit 5, Mockito (with AI-assisted test generation), enforced quality gates via JaCoCo & SonarQube; used Git, Jenkins CI, JFrog Artifactory.
- Conducted code reviews and AI-generated code validation for security, compliance, and contract compatibility; participated in Agile ceremonies and integrated with Finacle & COBOL systems.

Project2: DBS Customer Reverse Authentication (CRA) Security Mechanism

Duration: [MAY 2025– AUG 2025]

Description: Designed and implemented Customer Reverse Authentication (CRA) security mechanism for DBS banking systems, where the bank authenticates itself to the customer (reverse of normal authentication) to protect against fraudulent transactions and unauthorized access. CRA helps customers verify they are interacting with the legitimate DBS system by displaying personalized account information including last login time, account nicknames, recent transaction hints, and registered device details across ATM, phone banking, mobile banking, and large fund transfer scenarios. Achieved protection against phishing attacks, social engineering, man-in-the-middle attacks, and account takeover while enhancing customer confidence, fraud detection, and trust. This security mechanism is particularly critical for Singapore's banking landscape given sophisticated cyber fraud attempts.

Technologies: Java 17, Spring Boot 3.x, Spring Security, REST APIs, Microservices, MariaDB, Docker, Kubernetes, OpenShift, JUnit 5, Mockito, JaCoCo, SonarQube, Git, Jenkins, Agile/Scrum

Roles & Responsibilities:

- Designed and implemented CRA service where bank authenticates to customers using last login time, account nicknames, recent transaction hints, and registered device info to prevent phishing and account takeover.
- Integrated CRA across ATM, phone banking, mobile/internet banking, and large fund transfers — displaying partial account details on ATM, recent transaction hints for phone agents, login snapshot on mobile, and registered contact info for fund transfers.
- Built CRA response API using Builder pattern with fields like lastLoginTime, accountNickname, recentTransactionHint, registeredDeviceInfo; containerized with Docker and deployed on OpenShift.
- Maintained 85%+ unit test coverage (JUnit 5, Mockito), enforced code quality & security via SonarQube; used Git feature branch strategy and Agile methodology.
- Integrated with DBS Digi-Chassis framework for consistent security policy enforcement across all channels.

Project3: Token Management System (TMS) & Digital Tokens Security Platform

Duration: [AUG 2025– DEC 2025]

Description: Designed and implemented Token Management System (TMS), a centralized security platform managing digital tokens for secure authentication and transaction processing in DBS's banking ecosystem. TMS handles complete token lifecycle management including creation, validation, expiration, and revocation across various token types: Transaction Tokens (time-bound transaction authorization), API Access Tokens (OAuth 2.0 for third-party fintech applications). Achieved PCI DSS and MAS compliance, ensuring real card numbers and sensitive data are never exposed to merchants or external systems.

Technologies: Java 17, Spring Boot 3.x, Spring Security, OAuth 2.0, JWT, REST APIs, Microservices, MariaDB, Apache Kafka, Docker, OpenShift, API Gateway, JUnit 5, Mockito, JaCoCo, SonarQube, Git, Jenkins, Agile/Scrum.

Roles & Responsibilities:

- Designed and implemented centralized TMS managing complete token lifecycle (creation, validation, expiration, revocation) for Transaction Tokens (time-bound) and OAuth 2.0 API Access Tokens, ensuring PCI DSS & MAS compliance.
- Configured TMS for multi-channel support (mobile/internet banking, ATM, API Gateway); built Transaction Token service with time-bound validity (e.g., 5-min expiration for fund transfers).
- Implemented OAuth 2.0 based API Access Tokens for third-party fintech apps; containerized microservices with Docker, deployed on OpenShift.
- Added audit logging for all token events; maintained 85%+ unit test coverage (JUnit 5, Mockito); used SonarQube for security scanning, Git feature branching, and Agile practices.
- Conducted code reviews focused on security, encryption, and integration with DBS Digi-Chassis framework.

PROJECT 4: X-Value Adjustments (XVA)

Client: DBS Bank | **Role:** Senior Java Developer | Backend Engineer

Duration: JUL-2024 to Present

Description

Designed an automated Feign Client failover rolling data from reference → reference_fo_sg when the daily trade file is missing by 7:30 AM, ensuring seamless market data → pricing → trade operations. Implemented date-range-based log deletion and automated purging of 90+ day old datasets (daily at 12:00 AM) to optimize database performance. Added MariaDB SSL certificate validation for encrypted security compliance. Refactored inter-service communication by minimizing Feign Client dependencies and reducing unnecessary API calls to lower latency. Managed deployments via OpenShift, Jenkins, and Bitbucket with automated monitoring and performance tuning.

Technologies: Java, Spring Boot, Microservices, Kotlin, MySQL, Kibana, OCP (OpenShift), Jenkins, Bitbucket, Liquibase, Feign Client

Roles & Responsibilities:

- **Task Management & Requirement Analysis:** Collaborate with onshore managers to receive assigned tasks and clarify requirements. Analyze business requirements to assess impact and identify necessary changes.
 - **Development & Implementation:** Implement changes and enhancements in Java, Spring Boot, and Microservices as per specifications. Optimize service interactions by minimizing Feign Client dependencies and improving API efficiency.
 - **Testing & Deployment:** Deploy and validate changes across DEV → SIT → UAT environments to ensure functionality and stability. Troubleshoot and resolve issues before production rollout.
 - **Release & Documentation:** Collect and update development artifacts in Jira for task tracking and audit purposes. Modify and maintain SQL scripts in the Liquibase release branch for structured database versioning. Document all Liquibase artifacts and deployment details in Confluence for seamless team collaboration.
-

Senior Associate Consultant | Infosys | NOV-2022 to JUL-2024

PROJECT DETAILS:

Title: Travel and Lifestyle | **Client:** American Express | **Role:** Java/Microservices Developer | **Duration:** NOV-2022 to JUL-2024

Description:

Developed and maintained microservices for online/offline travel bookings (self-service & agent-assisted) for American Express.

Responsibilities: Built scalable **Spring Boot microservices** using JDBC and Web Services; applied design patterns (Singleton, DAO, Factory, MVC) for reusability and maintainability.

- Collaborated with designers on requirement analysis and sprint planning; provided **Work Breakdown Structures (WBS)** for progress tracking.
- Wrote **JUnit test cases** within same sprint; enforced code quality via peer reviews and tech lead approvals before merging to **GitHub**.
- Managed version control and deployments; resolved defects with QA teams to enhance stability.

Technologies: Java, Spring Boot, Microservices, JDBC, Web Services, JUnit, GitHub

Project Engineer | Wipro Technologies | AUG-2021 to OCT-2022

PROJECT DETAILS:

Title: Monitor/Aggregation Services | **Client:** Ericsson | **Role:** Java/Micro Services Developer/Automation Engineer | **Duration:** JUL-2021 to OCT-2022

Description:

Data received from end users is processed to calculate aggregations (daily, weekly, monthly, yearly) and pushed into Kafka topics for consumption by downstream services within Ericsson's internal operations ecosystem.

Responsibilities:

- Developed backend microservices using **Spring Boot, Spring Framework, JDBC, Spring Batch, Hibernate**, and design patterns (Singleton, DAO, Factory, DTO, MVC).
 - Implemented **consumer-based Spring Cloud Contract testing** to validate contracts between Monitor (consumer) and Aggregator (producer) services.
 - Automated testing within the same sprint using **JCAT Framework**; ensured code quality via tech lead reviews before pushing to **Gerrit** repository.
 - Gathered requirements from product owner, collaborated with system analysts to convert business needs into system requirements, and resolved development/production issues.
-

Systems Engineer | Tata Consultancy Services Ltd | JUNE-2018 to JUL-2021

Project 1: Personal Retirement Scheme

Client: American Century Investments | **Role:** Java/Microservices Developer | **Duration:** DEC-2019 to JUL-2021

Description:

Filtered and validated back-office data using Bloomberg Global ID for currencies/exchanges against American Century Investments' database.

Responsibilities:

Developed backend microservices using Spring Boot, REST APIs, JPA, JDBC, and SQL; designed frontend interfaces with HTML5, CSS3, JavaScript.

- Used Spring Batch (converted legacy batch jobs to Spring Boot Batch), Hibernate, and design patterns (Singleton, DAO, Factory, DTO, MVC).
 - Integrated JMS Queues to publish/process Bloomberg back-office data.
 - Converted business requirements with system analysts; ensured on-time delivery, production issue resolution, and Agile team collaboration.
-

Project 2: Retail Banking Project

Client: Citi Bank | **Role:** Java/Microservices Developer | **Duration:** JUN-2018 to DEC-2019

Description:

Built applications for opening savings accounts using credit card numbers; developed Source of Wealth (global microservice) and Cash Deposit Types modules.

Responsibilities

- Implemented REST microservices using Spring/Spring Boot; wrote unit tests with Mockito.
- Used core Java, collections, Servlet, JDBC, JPA, Hibernate, Spring Batch, and design patterns (Singleton, DAO, Factory, DTO, MVC).
- Designed frontend interfaces with HTML5, CSS3, JavaScript, managed code via GIT.
- Wrote unit tests for all modal classes; collaborated across teams for global microservice delivery.
